54 – Sahil Kabir

Aim: Create HIVE Database and Descriptive analytics-basic statistics.

Theory:

Hive is a database technology that can define databases and tables to analyze structured data. The theme for structured data analysis is to store the data in a tabular manner, and pass queries to analyze it. This chapter explains how to create Hive database. Hive contains a default database named default.

Create Database Statement

Create Database is a statement used to create a database in Hive. A database in Hive is a namespace or a collection of tables. The syntax for this statement is as follows:

CREATE DATABASE|SCHEMA [IF NOT EXISTS] <database name>

Here, IF NOT EXISTS is an optional clause, which notifies the user that a database with the same name already exists. We can use SCHEMA in place of DATABASE in this command. The following query is executed to create a database named userdb:

hive> CREATE DATABASE [IF NOT EXISTS] userdb;

hive> CREATE SCHEMA userdb;

The following query is used to verify a databases list:

hive> SHOW DATABASES;

default

userdb

Program:

The JDBC program to create a database is given below.

import java.sql.SQLException;

import java.sql.Connection;

import java.sql.ResultSet;
CSL702: Big Data Analytics Lab

```java
import java.sql.Statement;

import

java.sql.DriverManager;

public class HiveCreateDb {

    private static String driverName = "org.apache.hadoop.hive.jdbc.HiveDriver";

    public static void main(String[] args) throws SQLException {

        // Register driver and create driver instance

        Class.forName(driverName);

        // get connection

        Connection con =
DriverManager.getConnection("jdbc:hive://localhost:10000/default","", "");

        Statement stmt = con.createStatement();

        stmt.executeQuery("CREATE DATABASE userdb");

        System.out.println("Database userdb created successfully.");

        con.close();

    }

}
```

Output:

Database userdb created successfully.

```
hive> SHOW DATABASES;

CONCLUSION:

In conclusion, creating a Hive database and performing descriptive analytics with basic statistics is a fundamental step in harnessing the power of big data for decision-making. Hive provides a structured and SQL-like interface to query and analyze data stored in Hadoop HDFS. By establishing a Hive database, organizations can efficiently manage and structure their data for analysis. Performing descriptive analytics with basic statistics offers valuable insights into the data's characteristics, such as central tendencies, distributions, and outliers. This process lays the foundation for more advanced analytics and data-driven insights, aiding in better-informed business strategies and decisions.
